

MBF AMISYS DATAMART™

Data marts deliver an integrated view of your business with quick and easy access to functional or departmental information

Don't let your business suffer because your analytical needs are not being met? Envision a solution that is scalable to any size, fits into the existing enterprise architecture, and can be modified quickly to reflect your changing environment and user requirements.

Business is about transforming data into information. Data marts meet that need by simplifying the process of sharing information. With a predefined scope and a focused audience, you can access and manipulate data to meet your objectives. Using the desktop tools of their choice, users are not confronted with the difficult learning curves associated with new product solutions.

Each data mart is designed specifically for the source application. The MBF Amisys DataMart accesses the operational data from the Amisys application. The data is denormalized, transformed into usable business information and stored in a simplified structure. New and changed data is captured through transaction dates or according to your needs. Voided records are removed.

Simplified data structures, coupled with fast efficient indexing translate into 'no-wait' response times. Flexible indexing allows the data mart to be customized to match your organizational trends.

Business processes generate massive amounts of information. Data marts deliver an integrated view of your business with quick and easy access to function or department specific information. Measure critical success factors including financial benchmarks, such as trapping of claims and related services, analysis and payment of those claims.

Quick and easy access to information will improve your decision making by removing the guesswork, improve customer service by providing claim status information promptly/efficiently, remove the onerous information retrieval time, and improve claim processing time.

The MBF Amisys DataMart is a seamless integration built to help you take advantage of the benefits associated with implementing a successful data mart. Business intelligence just became easier with the MBF Amisys DataMart.

The MB Foster full solution DataMart for Amisys delivers the following:

- ◆ MBF-UDALink™, a robust data access, delivery & reporting tool for mining and gathering data
